

## **ABSTRACT**

The present invention relates to a device and method for preparing liquid from solid materials such as medicinal materials. It comprises preparing materials for preparing liquid and liquid at the beginning, and obtaining prepared liquid at the end. Wherein it uses steam generator 2, intermediate switch valve 6 and material chamber 8, which is protruded into by outlet pipe 10 which is at the bottom of material chamber 8. It further comprises steps as follows: distillation and absorption; immersion; repetition. The device and method for preparing liquid adopts the way of repeating the distillation and dip alternately, reducing harmful substance in preparing liquid by conventional methods. If not only extracts soluble effective matter, but also reducing the loss of volatile effective matter. Ulteriorly, it makes the steps for preparing liquid simple and clear, it can prepare liquid quantificationally, effectively and not pasty and shrinkable, simultaneously it realizes the auto control by means of electricity detect and control, copes with the defects by conventional poaching.
